AI FOR FINANCE CIA-2

Assignment: AI-Powered Project Development

Instructions: Build a working project using Artificial Intelligence (AI) tools. Each project should address a real-world financial problem. Students must demonstrate how AI is used in developing the project and explain its features, functionality, and benefits.

1. AI-Powered Personal Finance Management System

Build an application that uses AI to track income and expenses, categorize transactions, analyze spending patterns, and provide personalized recommendations to improve savings.

2. AI-Based Stock Market Analysis and Prediction System

Develop an AI-powered application that analyzes historical stock market data, identifies market trends, and generates insights to help users understand potential investment opportunities.

3. AI-Powered Fraud Detection System

Build a system that uses AI to analyze financial transactions and identify potentially fraudulent activities based on unusual transaction patterns.

4. AI-Based Loan Eligibility and Risk Assessment System

Develop an application that analyzes an applicant's financial information, income, credit history, and existing debts to assess loan eligibility and estimate credit risk.

5. AI-Powered Financial Chatbot

Build an intelligent chatbot that answers users' questions about budgeting, savings, loans, investments, and financial planning using natural language processing and AI.

General Requirements

- Use AI tools to assist in designing and developing the project.
- Build a working application with a user-friendly interface.
- Demonstrate the project's main features with sample data.
- Explain how AI is used in the project.
- Submit the project source code and a brief project report.
- Present the working project and explain its practical applications.
